Asociación para Evitar la Ceguera en México I.A.P. HOSPITAL "DR. LUIS SÁNCHEZ BULNES"

Purpose

Primary:

• To compare long-term effects of phacoemuls ification on intraocular pressure (IOP) in patients with primary open-angle glaucoma (POAG) and pseudoexfoliation glaucoma (PXG).

Secondary:

• To compare the change in the number of topical hypotensive drugs used and visual fields values (mean deviation and visual field index).

Methods

- Longitudinal, retrospective, observational and descriptive study
- Asoc. Para Evitar la Ceguera (Mexico City), January 2018 January 2019

Demographics characteristics

- Baseline •
- Postoperative day 1, week 1, month 1, 3, 6, and 12

Visual fields data

- Baseline
- Postoperative months 3, 6, and 12.

Exclusion criteria

- BCVA < 20/400
- Any other corneal or retinal • disease

Methods

- Success: Failure:
- IOP \downarrow 15% compared with • IOP >21 mmHg at 2 consecutive visits preop
 - Complete • IOP $\downarrow < 15\%$ compared with •
 - Qualified

preop

Results

- A total of 674 surgical procedures
- 102 eyes met criteria

Results

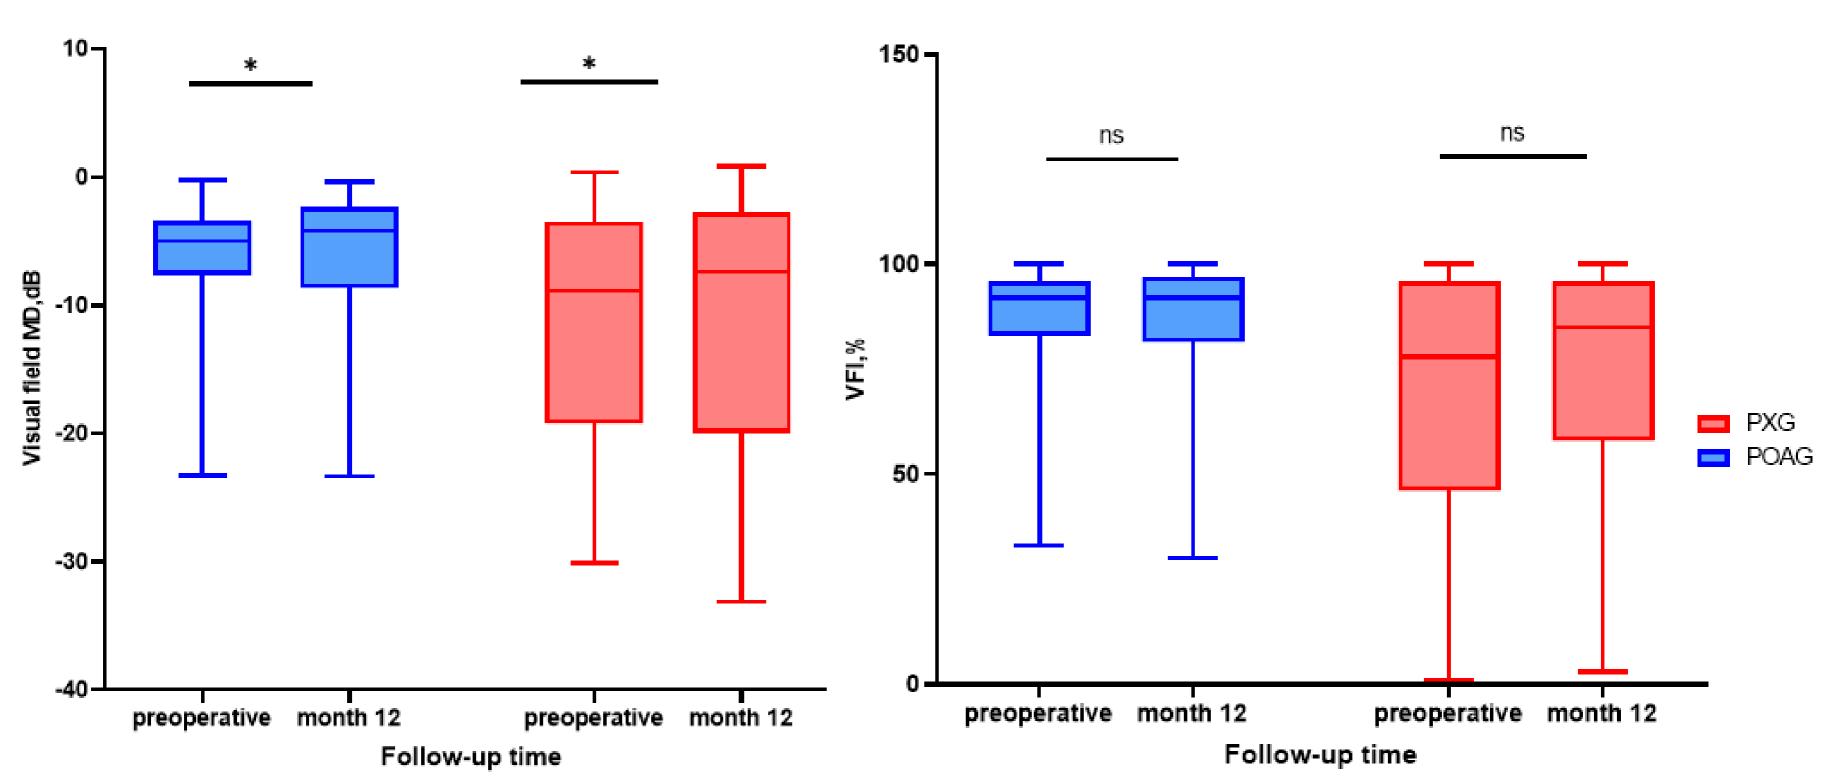

preoperative IOP, mmHg

Results

Mean deviation (MD)

Visual field index (VFI)

Conclusions

- Hispanic population exhibit an IOP behavior similar to what is reported in other ethnic groups.
- PXG group have a significant amount of IOP reduction probably associated with a higher presurgical IOP (p=0.001).
- POAG group have a statistically significant reduction in the number of glaucoma medications (p=0.026)
- Limitations: retrospective nature, non-standardized groups, multiple surgeons.
- More prospective studies on Hispanic population would guide us as to whether this is a good initial measure for certain patients.
